Engineering, Amrita School of Engineering
Amritapuri Campus, Kollam, Kerala, India.**

**Master of Technology (M.Tech.)
in
Thermal and Fluids Engineering**

Curriculum and Syllabus

Revised on: May 2025

Previous revisions: 2023, 2021, 2017, 2015, 2011

Preface

As the energy and process sector in India is in a boom, the need of the hour is engineers with strong background in thermal and fluid sciences capable of carrying out conceptual design. The program is aimed at providing sufficient theoretical, computational and experimental knowledge in the thermal and fluid sciences. It also encapsulates simulation and experimental skills applied to IC engines, power plant, aerospace and gas turbines research. The program is designed to equip students to perform design related to linear and nonlinear steady state/ transient heat transfer, steady and unsteady fluid flow, multiphase flows, fluid structure interactions viz., estimation of thermal and pressure loads and coupled field analysis.

The program provides required numerical simulation techniques for design and analysis of equipment like gas turbines and accessories, steam turbines and reactor pipes, heat exchangers, compressors, turbines, pumps, propellers, rotor stator interactions, flow separators, inlet manifolds, volutes, turbochargers etc. The program includes adequate courses for numerical analysis and computer simulation of thermal engineering problems. The course also introduces the student to experimental techniques like flow visualization, combustion diagnostics, particle characterization and other recent imaging techniques adopted in the field of thermal research. As automation is being introduced in various fields of research and industry, new courses covering these topics are also included. Students will be eligible for the post of design/research engineers in industries related to thermal and fluid sciences. This program provides excellent background needed to employment in various R&D organizations and also for high quality academic research.

Program Educational Objectives of the M.Tech (Thermal & Fluids Engineering)

PEO1: This program offers a state-of-the-art academic curriculum designed for students from Mechanical Engineering, Aerospace Engineering, and Chemical Engineering, exposing them to various subjects related to thermal and fluid engineering and providing the necessary technical knowledge to master the field.

PEO2: This program offers a comprehensive educational environment, enabling students to gain expertise in various thermo-fluid systems of practical relevance.

PEO3: Expose students to the designed coursework and practical thermo-fluid systems, and prepare them to become engineers/designers in industries, researchers in academia and R&D organizations.

Program Outcomes (POs)

PO1: An ability to independently carry out research /investigation and development work to solve practical problems.

PO2: An ability to write and present a substantial technical report/document.

PO3: Students should be able to demonstrate a degree of mastery over the area as per the specialization of the program. The mastery should be at a level higher than the requirements in the appropriate bachelor's program.

Program Specific Outcomes (PSOs)

PSO1: Apply the concepts to solve problems related to thermal and fluids engineering using modern tools.

PSO2: Apply the principles of thermo-fluids engineering to design and build innovative solutions for industry and society at large.

CURRICULUM
M.TECH.THERMALANDFLUIDSENGINEERING(TFE)

FirstSemester

SYLLABUS

First Semester

25MA605	Advanced Engineering Mathematics	L	T	P	C
		3	0	3	4

Module-1

Linear Algebra: Linear dependence/independence of vectors, Rank of matrices, System of linear equations, Solution of system of linear equations, Vector spaces, Subspaces, Generating set, Basis, Dimension of vector spaces, Linear mapping, Transformation matrix, Basis change, Image and Kernel of linear mapping, Affine spaces, Norm of a vector space, Dot product, Quadratic form, symmetric positive definite matrices, Length, angle and orthogonality, Orthonormal basis, Inner product of functions, Orthogonal projections, Gram Schmidt orthogonalization, Eigen values and vectors, Matrix decomposition: Cholesky decomposition, Eigen decomposition, Singular value decomposition, Matrix approximation.

Module-2

Vector calculus: Differentiation and Taylor's series expansion of univariate functions, Partial differentiation, chain rule, Gradient of vector function (Jacobian), Gradient of a vector with respect to a matrix, Identities for computing gradients, Back propagation and automatic differentiation, Gradients in deep neural networks, Higher order partial derivatives, Hessian, Taylor's series expansion of multivariate functions, Vector calculus for physical field problems, divergence and curl of vector fields, rotational and irrotational vector fields, Conservative vector fields, Vector integral calculus, line, surface and volume integrals, Stoke's theorem, Green's theorem and Gauss divergence theorem,
Probability: Introduction to Probability concepts, one dimensional and two dimensional Random variables, Jointly Distributed Random Variables, Conditional Distributions.

Module-3

Solution using iterative methods: Gauss Seidel, SOR (point and line), Conjugate gradient, BiCGStab, GMRES, Solution of systems of nonlinear algebraic equations.
Interpolations: Newton, Stirling, Lagrange, Richardson, Quadratic and Cubic splines, Inverse interpolation.
Numerical Differentiation; Numerical integration: Higher-Order Newton-Cotes formulas, Romberg integration, multiple integrals.

Lab Session

- Verify vector dependence/independence, find rank, basis, dimension, eigenvalues/eigenvectors, and perform matrix decompositions (Cholesky, Eigen, SVD) using **MATLAB / Python with NumPy and SciPy**.
- Calculate gradients, Jacobians, Hessians, Taylor series expansions, and implement backpropagation and automatic differentiation using **MATLAB / PyTorch or TensorFlow in Python**.
- Solve linear and nonlinear equations using iterative methods like Gauss-Seidel, SOR, Conjugate Gradient, BiCGStab, and GMRES with **MATLAB / SciPy in Python**.
- Apply interpolation (Newton, Lagrange, Stirling, splines), numerical differentiation, and

integration (Newton-Cotes, Romberg, multiple integrals) using **MATLAB / SciPy in Python**.

TEXTBOOKS/REFERENCES

- [1] Advanced Engineering Mathematics – Ervin Kreyszig, 10th edition (2015), Wiley.
- [2] Linear algebra and its application – Gilbert Strang, 5th edition (2018), Cengage Learning.

- [5] Mathematics for Machine Learning – Marc Peter Deisenroth, A. Aldo Faisal, Cheng Soon Ong, Cambridge University Press (2020)
- [6] Machine learning: A probabilistic perspective, Kevin Murphy, MIT Press (2012).

Course Outcomes

CO1: Capability to understand mathematical notations and solve problems in linear algebra. CO2: Capability to do gradient evaluations of objective functions in optimization problems. CO3: Capability to do scalar and vector field operations. CO4: Capability for solving mathematical equations modelled as differential equations. CO5: Solve problems in distribution of random variables and parameter estimation.

25TF601

Advanced Fluid Dynamics

L	T	P	C
2	1	0	3

Module-1

Review of Basic Concepts: Concept of continuum, types of fluid and fluid properties – Kinematics of fluid flow - Vorticity and circulation - Potential flows: velocity potential and stream function, flow nets – Ideal Fluid Flow Analysis: Two-dimensional flow in rectangular and polar coordinates – sources, sinks, doublets, flow over a circular cylinder, vortex flows.

Module-2

Reynolds Transport Theorem, Integral fluid flow analysis - Differential Fluid Flow Analysis: differential forms of mass, linear momentum, angular momentum and energy conservation equations. Navier-Stokes equations and exact solutions – Couette flow, Poiseuille flow, Hagen–Poiseuille flow. Approximate solutions: Creeping flow, inviscid flow, irrotational flow. Euler's equation for turbomachines, Introduction to various types of turbo machines.

Module-3

Boundary Layer Theory: Laminar Boundary Layer Equation, Two dimensional equations, displacement and momentum thickness, general properties of the boundary layer equations, Blasius solution. Von-Karman Momentum integral equation and skin friction drag. Turbulent Boundary Layer: Two-dimensional equation, Prandtl's mixing layer Karman's hypothesis universal velocity distribution, flow over a flat plate, skin friction drag.

- [8] Pijush J Kundu, Ira M Cohen., Fluid Mechanics, Elsevier, 5th Edition, 2012.

Course Outcomes

- CO1: Develop fundamental knowledge in the subject of fluid mechanics
- CO2: Capability to analyze fluid flows of different types associated with different engineering situations
- CO3: Develop skill to propose solutions to fluid flow problems to cater to industrial needs
- CO4: Capability to conduct research activities in the area of fluid mechanics

25TF602

Advanced Heat Transfer

L	T	P	C
2	1	0	3

Module-1

Fourier's law, thermal conductivity of matter, heat diffusion equation for isotropic and anisotropic media, boundary and initial conditions. One-dimensional steady-state conduction through plane wall, cylinder and sphere. Conduction with thermal energy generation, heat transfer from extended surfaces, radial fins and fin optimization; Multidimensional-steady-state heat conduction; Transient conduction – lumped capacitance method and its validity, plane wall and radial systems, semi-infinite solid, anisotropic conduction. Review of viscous flow: Hydrodynamic and thermal boundary layers, Laminar flow heat transfer to developed and developing flow, laminar forced convection in pipe and ducts with different boundary conditions, external flows.

Module-2

Turbulence modeling, Heat transfer in turbulent boundary layers, Eddy diffusivity of heat and momentum, turbulent flow through circular tubes and parallel plates with heat transfer, analogies between heat and momentum transfer. Laminar natural convection, natural convection in enclosures, heat transfer correlations. Turbulent natural convection, turbulent heat transfer correlation, Practical applications. Boiling and condensation heat transfer – correlation and applications. Heat transfer with phase change: Pool boiling, convective boiling, film and dropwise condensation, empirical relations for heat transfer with phase change.

Module-3

Heat Exchangers: Types, classifications, selection, standards, parallel, counter and mixed flow, multiple passes, LMTD, correction factors, effectiveness, NTU methods. Practical problems and examples which covers the modelling of various heat transfer systems drawn from industrial fields such as manufacturing, electronics, consumer products, and energy systems etc.

Radiation heat transfer, blackbody radiation, Planck distribution, Wien's displacement law, Stefan-Boltzmann law, surface emission, surface absorption, reflection, and transmission, Kirchoff's law, gray surface; Radiation intensity and its relation to emission, irradiation and radiosity, View factors and radiation exchange between surfaces. Elements of inverse heat transfer.

- [6] Shah R.K. and Sekulic D.P., Fundamentals of Heat Exchanger Design, John Wiley and Sons, 2002.

Course Outcomes

CO1: Deal with the practical situations which involve one or more than one modes of heat transfer

CO2: Deal with transient and multi-dimensional conduction problems

CO3: Analyse the situation including fluid flow and heat transfer

CO4: Deal with the effect of radiation and heat transfer associated with it in practical situations

CO5: Understand the concepts of condensation and boiling

CO6: Design heat exchangers using LMTD and NTU methods. Introduction to refrigeration.

25TF603

Advanced Engineering Thermodynamics

L	T	P	C
2	1	0	3

Module-1

Review of I and II Laws of Thermodynamics, irreversibility and availability, concept of entropy and entropy generation, exergy. Maxwell's equations, Joule-Thomson experiment. Thermodynamic cycles and cycle efficiency, exergy analysis of power and refrigeration cycles. New generation power plants - Negative emission power plants, Environmental impact of power plants.

Module-2

Thermodynamic Properties of Homogeneous Mixtures: Partial molar properties, phase equilibrium, multi-component and multi-phase systems, equations of state, The van der Waals equation of state. Kinetic theory of gases, principle of equipartition of energy, collision cross section, mean free path. Statistical thermodynamics introduction, energy states and energy levels, macro and micro scales.

Module-3

Thermodynamics of reactive systems: First and second law analysis of chemical reactions, thermo-dynamics of combustion, flames, adiabatic flame temperature.

Thermodynamics of irreversible processes: Phenomenological laws, reciprocity relation, applicability of the phenomenological relations, heat flux and entropy production, thermodynamic phenomena, thermoelectric phenomena.

Gas dynamics: Basic concepts, Effect of Mach number on compressibility, Isentropic Flow, concept of Normal and oblique shocks etc.

TEXTBOOKS/REFERENCES

- [6] Stephen R. Turns, An Introduction to Combustion: Concepts & Applications, McGraw-Hill Education, 3rd Edition, 2012.

Course Outcomes

CO1: Understand and apply the thermodynamic principles to reacting and non-reacting systems.

CO2: Understand the thermodynamic properties of homogeneous mixtures.

CO3: Understand the concept of kinetic theory and statistical thermodynamics.

CO4: Apply the thermodynamic principles to irreversible processes.

CO5: Analyse the performance of new generation power plant and fuel cell systems.

25TF604

Machine Learning

L	T	P	C
3	0	3	4

Module-1

Introduction to Machine Learning – Data and Features –

Machine Learning Pipeline: Data Preprocessing: Standardization, Normalization, Missing data problem, Data imbalance problem

Data visualization - Setting up training, development and test sets – Cross validation – Problem of Overfitting, Bias vs Variance – Evaluation measures –

Different types of machine learning: Supervised learning, Unsupervised learning, Reinforcement learning, Generative Learning and adversarial learning.

Module-2

Supervised learning - Regression: Linear regression, logistic regression – Classification: K-

Nearest Neighbor, Naïve Bayes, Decision Tree, Random Forest, Support Vector Machine, Perceptron, Error analysis.

Module-3

Unsupervised learning – Clustering: K-means, Hierarchical, Spectral, subspace clustering,

Gaussian Mixture Model, Hidden Markov Model, Parameter Estimation: MLE and Bayesian Estimate, Expectation Maximization, Dimensionality Reduction Techniques, Principal component analysis, Linear Discriminant Analysis.

Module-4

Introduction to Neural Networks, Reinforcement learning and generative learning.

Lab Session

- Perform data preprocessing (missing values, standardization, normalization, data imbalance) and data visualization; implement cross-validation using **Python with pandas, scikit-learn, and matplotlib**.
- Implement regression (linear, logistic) and classification (KNN, Naïve Bayes, Decision Tree, Random Forest, SVM, Perceptron) models with error analysis using **scikit-learn in Python**.
- Apply clustering (K-means, hierarchical, spectral), dimensionality reduction (PCA, LDA), and parameter estimation (MLE, Bayesian, EM for Gaussian Mixture Models) using **scikit-learn in Python**.
- Develop basic neural networks, reinforcement learning, and generative learning models using **TensorFlow or PyTorch in Python**.

Course Outcomes

- CO1: Apply pre-processing techniques to prepare the data for machine learning applications
CO2: Implement supervised machine learning algorithms for different datasets
CO3: Implement unsupervised machine learning algorithms for different datasets
CO4: Analyze the error to improve the performance of the machine learning models

25TF681	Experimental Methods for Thermal and Fluids Engineering	L	T	P	C
		0	0	3	1

EXPERIMENTS

1. a) Pipe friction apparatus b) Reynolds apparatus
2. a) Thermal conductivity of solids b) Heat transfer through pin fin
3. a) Notch apparatus b) Pelton wheel test rig
4. a) Forced convection heat transfer b) Natural convection heat transfer
5. a) Verification of Bernoulli equation b) Centrifugal pump test rig
6. a) Parallel & counter flow heat exchanger b) Shell and tube heat exchanger
7. a) Meta-centre apparatus b) Venturi and orifice meter test rig
8. a) Stephan-Boltzmann apparatus b) Emissivity apparatus
9. a) Francis turbine test rig b) Hele-Shaw flow apparatus
10. R & A test rig.

Course Outcomes

- CO1: Gain confidence and develop physical insight into the fundamental concepts in fluids and thermal engineering
CO2: Identifying sources of errors in experiments and estimate uncertainty
CO3: Understand and utilize curve fitting techniques.

25RM609	Research Methodology	L	T	P	C
		4	0	0	4

Module 1

Meaning of Research, Types of Research, Research Process, Problem definition, Objectives of Research, Research Questions, Research design, Approaches to Research, Quantitative vs. Qualitative Approach, Understanding Theory, Building and Validating Theoretical Models, Exploratory vs. Confirmatory Research, Experimental vs Theoretical Research, Importance of reasoning in research.

Problem Formulation, Understanding Modeling & Simulation, Conducting Literature Review, Referencing, Information Sources, Information Retrieval, Role of libraries in Information Retrieval, Tools for identifying literatures, Indexing and abstracting services, Citation indexes.

Module 2

Experimental Research: Cause effect relationship, Development of Hypothesis, Measurement Systems Analysis, Error Propagation, Validity of experiments, Statistical Design of Experiments, Field Experiments, Data/Variable Types & Classification, Data collection, Numerical and Graphical Data Analysis: Sampling, Observation, Surveys, Inferential Statistics, and Interpretation of Results.

Module 3

Preparation of Dissertation and Research Papers, Tables and illustrations, Guidelines for writing the abstract, introduction, methodology, results and discussion, conclusion sections of a manuscript. References, Citation and listing system of documents Intellectual property rights (IPR) - patents - copyrights - Trademarks - Industrial design geographical indication. Ethics of Research - Scientific Misconduct - Forms of Scientific Misconduct. Plagiarism, Unscientific practices in thesis work, Ethics in science.

Course Outcomes

CO1: To define research, methodology and steps involved in research.

CO2: To learn to define a problem, and a research hypothesis. To understand the importance of literature survey, gaps and challenges.

CO3: To learn the basic concepts of research design, sampling, modeling & simulation and understand the importance of citation, H-index, Scopus.

CO4: To learn to write technical report, paper and thesis.

CO5: To know about intellectual property rights, ethics in research and plagiarism.

25AVP501

Mastery over Mind

L	T	P	C
1	0	2	2

Scientific benefits of Meditation (CO1)

Scientific benefits of meditation, exploring its effects on physical and mental wellbeing.

Learn about the different types of meditation practices, the essential elements of meditation, and the empirical evidence supporting its benefits.

Video resource-Swami Atmanandamrita Puri

Science Behind Meditation (CO2)

A: A preliminary understanding of the Science of meditation. What can modern science tell us about this tradition-based method?

B: How meditation helps humanity according to what we know from scientific research

Reading 1: Does Meditation Aid Brain and Mental Health (Dr Shyam Diwakar)

Reading 2: 'Science and Spirituality.' Chapter 85 in Amritam Gamaya (2022). Mata

Amritanandamayi Mission Trust.

Role of Meditation in Emotional intelligence (CO3)

Learn how meditation practices can enhance self-awareness, self-regulation, motivation, empathy, and social skills, leading to improved relationships and decision-making. Improve communication, emotional intelligence, and interpersonal skills. Logical and analytical reasoning

Practicing MA OM Meditation in Daily Life (CO4)

Guided Meditation Sessions following scripts provided (Level One to Level Five)

Reading 1: MA OM and White Flower Meditation: A Brief Note (Swami Atmananda Puri)

Reading 2: 'Live in the Present Moment.' Chapter 71 in Amritam Gamaya (2022). Mata

Amritanandamayi Mission Trust.

Meditation and Compassion-driven Action (CO5)

Understand how meditation can help to motivate compassion-driven action.

Reading 1: Schindler, S., & Friese, M. (2022). The relation of mindfulness and prosocial behavior: What do we (not) know? *Current Opinion in Psychology*, 44, 151-156.

Reading 2: 'Sympathy and Compassion.' Chapter 100 in Amritam Gamaya (2022). Mata Amritanandamayi Mission Trust.

23HU601

Career Competency I

L	T	P	C
0	0	3	P/F

Soft Skills

Introduction to ‘campus to corporate transition’.

Communication and listening skills:Communication process, barriers to communication, verbal and non-verbal communications, elements of effective communication, listening skills, empathetic listening, role of perception in communication.

Assertiveness skills:The concept, assertiveness and self-esteem, advantages of being assertive, assertiveness and organizational effectiveness.

Self-perception and self-confidence:Locus of control (internal v/s external), person perception, social perception, attribution theories-self presentation and impression management, the concept of self and self-confidence, how to develop self-confidence.

Goal setting:The concept, personal values and personal goals, goal setting theory, six areas of goal setting, process of goal setting: SMART goals, how to set personal goals

Time management: the value of time, setting goals/ planning and prioritizing, check the time killing habits, procrastination, tools for time management, rules for time management, strategies for effective time management

Presentation skills:The process of presentation, adult learning principles, preparation and planning, practice, delivery, effective use of voice and body language, effective use of audio visual aids, dos and don'ts of effective presentation

Public speaking: An art, language fluency, the domain expertise (Business GK, Current affairs), self-confidence, the audience, learning principles, body language, energy level and conviction, student presentations in teams of five with debriefing

Verbal

Vocabulary: Familiarize students with the etymology of words, help them realize the relevance of word analysis and enable them to answer synonym and antonym questions. Create an awareness about the frequently misspelt words, commonly confused words and wrong form of words in English.

Grammar: Train students to understand the nuances of English Grammar and thereby enable them to spot grammatical errors and punctuation errors in sentences.

Reasoning: Stress the importance of understanding the relationship between words through analogy questions and learn logical reasoning through syllogism questions. Emphasize the importance of avoiding the gap (assumption) in arguments/ statements/ communication.

Oral Communication Skills: Aid students in using the gift of the gab to improve their debating skills.

Writing Skills: Introduce formal written communication and keep the students informed about the etiquettes of email writing. Make students practise writing emails especially composing job application emails.

Aptitude

Numbers: Types, Power Cycles, Divisibility, Prime, Factors & Multiples, HCF & LCM, Surds, Indices, Square roots, Cube Roots and Simplification.

Percentage: Basics, Profit, Loss & Discount, and Simple & Compound Interest.

Ratio, Proportion & Variation: Basics, Alligations, Mixtures, and Partnership.

Averages: Basics, and Weighted Average.

Time and Work: Basics, Pipes & Cistern, and Work Equivalence.

Time, Speed and Distance: Basics, Average Speed, Relative Speed, Boats & Streams, Races and Circular tracks.

Statistics: Mean, Median, Mode, Range, Variance, Quartile Deviation and Standard Deviation.

Data Interpretation: Tables, Bar Diagrams, Line Graphs, Pie Charts, Caselets, Mixed Varieties, and other forms of data representation.

Equations: Basics, Linear, Quadratic, Equations of Higher Degree and Problems on ages.

Logarithms, Inequalities and Modulus: Basics

Courseoutcomes

CO1:Soft Skills - To develop positive mindset, communicate professionally, manage time effectively and set personal goals and achieve them.

CO2:Soft Skills - To make formal and informal presentations with self-confidence.

CO3:Aptitude - To analyze, understand and employ the most suitable methods to solve questions on arithmetic and algebra.

CO4:Aptitude - To analyze, understand and apply suitable techniques to solve questions on logical reasoning and data analysis.

CO5:Verbal - To infer the meaning of words and use them in the right context. To have a better understanding of the nuances of English grammar and become capable of applying them effectively.

CO6:Verbal - To identify the relationship between words using reasoning skills. To understand and analyze arguments and use inductive/deductive reasoning to arrive at conclusions and communicate ideas/perspectives convincingly.

Second Semester

25TF611	Computational Fluid Dynamics and Heat Transfer	L	T	P	C
		3	0	3	4

Module 1

Review of Conservation equations for mass, momentum and energy; Equations in rectangular, cylindrical and spherical coordinate systems; Eulerian and Lagrangian approach, Conservative and non-conservative forms of the equations, rotating co-ordinates. Classification of system of PDEs: parabolic, elliptic and hyperbolic; Boundary and initial conditions; Numerical Grid Generation: Basic ideas, transformation and mapping, unstructured grid generation, hybrid grids, moving grids, unmatched meshes, CGNS notation for grid and data, mesh-free calculations.

Module 2

Finite Volume Method: Basic methodology, finite volume discretization, approximation of surface and volume integrals, interpolation methods - Central, Upwind, Hybrid, Power Law and QUICK formulations and comparison for convection-diffusion problem; TVD schemes, Flux limiter functions; Advanced Finite Volume methods: FV discretization in two and three dimensions, SIMPLE algorithm and flow field calculations, variants of SIMPLE- SIMPLER, SIMPLEC; PISO and PIMPLE algorithms.

Module 3

Turbulence and turbulence modeling, Introduction to turbulence modeling, Reynolds stress, RANS model, one-, two- and multiple equations for turbulence modeling; Reynolds Stress Transport Model; Large Eddy Simulation, Detached Eddy Simulation and Direct Numerical Simulation methods; Illustrative flow computations using CFD codes. CFD methods for compressible and high-speed flows; reacting flows. Finite element methods: Introduction to Finite Element Analysis, formulation of finite element methods for heat transfer in solids, formulation of finite element methods for fluid flows: Incompressible flows, Navier-Stokes equations including heat transfer. Formulation for fluid-structure interactions: Moving mesh and adaptive mesh, acoustic fluids coupled to structures, Navier-Stokes fluids coupled to structures. Commercial software – grid generation, flow prediction and post-processing. Validation methods for CFD analysis. Introduction to open source CFD packages and solution to practical problems, Introduction to turbulence models.

Lab Session

- Solving 1D and 2D heat diffusion problem without heat generation using finite volume techniques using Python/Matlab.
- Solving 1D and 2D heat diffusion problem with heat generation using finite volume techniques using Python/Matlab.
- Solving unsteady 1D heat diffusion problem without heat generation using finite volume techniques using Python/Matlab.
- Simulate 2D incompressible laminar flow through a rectangular channel. Determine the velocity profile at various locations and compare with the analytical parabolic profile for Poiseuille flow using Ansys Fluent/OpenFOAM.

Course outcomes

CO1: Familiarization with conservation equations in different forms and ability to classify a system of PDEs.

CO2: Apply FVM techniques for diffusion and convection-diffusion problems.

CO3: Understand and apply different pressure-velocity coupling for incompressible flows.

CO4: Numerical modelling of turbulence and ability to choose the most optimum one for a problem.

CO5: Solution of compressible fluid flows and its applications. CO6: Usage of commercial and open source CFD codes.

25TF612

Introduction to Deep Learning

L	T	P	C
3	0	3	4

Module-1

Deep Neural Networks (DNN) – Convolutional Neural Network (CNN) – Recurrent Neural Network (RNN): Long-Short-Term-Memory (LSTM) – Graph-based Neural Network (GNN)

Module-2

Pre-processing: Noise Removal using deep learning algorithms – Feature Extraction – Signal Analysis: Time Series Analysis, CNNs, Auto encoders.

Module-3

Image Analysis: Transfer Learning, Attention models – Ensemble Methods for Signal and Image Analysis.

TEXTBOOKS/REFERENCES

- [1] Bishop C. M., “Pattern Recognition and Machine Learning”, Springer, 1st Edition, 2006.
- [2] Goodfellow I, Bengio Y, Courville A, & Bengio Y, “Deep learning”, Cambridge: MIT Press, 1st Edition, 2016.
- [3] Soman K. P, Ramanathan. R., “Digital Signal and Image Processing – The Sparse Way”, Elsevier, 1st Edition, 2012.

Course Outcomes

CO1: Apply the fundamentals of deep learning.

CO2: Apply deep learning algorithms using

Matlab/Python. CO3: Apply deep learning models for signal analysis.

CO4: Implement deep learning models for image analysis.

Lab Session

- Build DNN, CNN, RNN, and LSTM models using **TensorFlow or PyTorch (Python)**.
- Develop GNN models using **PyTorch Geometric or TensorFlow with Spektral (Python)**.
- Perform signal preprocessing, feature extraction, and time series analysis with CNNs and Autoencoders using **TensorFlow/Keras (Python)**.
- Apply transfer learning, attention models, and ensemble methods for image and signal analysis using **TensorFlow or PyTorch (Python)**.

25TF613

Automation and IoT

L	T	P	C
3	0	0	3

Module-1

Fundamentals of Measurement Systems, Instrument Types and Performance Characteristics, sources of error, classification and elimination of error. Signal Conditioning. Data acquisition. Probes. Sensors - Pressure, Flow, Level, Temperature

Introduction to control systems – open and closed loop control systems – Modeling of simple mechanical and electrical systems – transfer functions. Time response characteristics of control systems, Stability analysis of control systems, Frequency Response, Introduction to PI, PD and PID controllers, Design of a PID controller

Module-2

Introduction to Automation - Automated manufacturing systems. Sensors and Actuators in Automation - Digital and analog sensors; Fluid power actuators; Control valves; Electrical system elements; Motors drives; Mechanical devices.

Pneumatic and Hydraulic Systems - Pneumatic fundamentals - control elements, position and pressure sensing – logic circuits - switching circuits - sequential circuits - cascade method. Control Using PLCs -

Relay logic; Combinational and sequential control, Sequential flowchart, Minimization of logic equations; Ladder logic diagrams; Programmable logic controllers (PLCs); PLC components; Programming; I/O addresses; Timer and counters; A/D conversion and sampling; PLC applications.

Module-3

Industry 4.0 & IoT: Introduction. Digitization, Drivers of Industry 4.0, End-to-end digital integration within a smart factory, IOT Swarm Sensors, RF and wireless sensors module, power management module; Challenges.

Internet of Things (IoT): Introduction, Physical system, Cyber-Physical Systems, IoT Architectures. Applications: Smart cities & smart homes, connected vehicles, IoT for temperature

dependent cooling system, engine management system, machine condition monitoring and health care monitoring.

Course Outcomes

- CO1: Select and use various measuring instruments for a practical application
- CO2: Design controllers based on stability and performance requirements
- CO3: Design pneumatic and hydraulic circuits
- CO4: Program PLC for a given application
- CO5: Apply IOT to different applications

25TF699	Project Seminar	L	T	P	C
		0	0	3	1

This seminar forms the pre-runner to the final year project in which students are expected to do a thorough literature survey and formulate a research problem on the broad topic given by the faculty. Students shall extensively study the research already carried out on the seminar topic. They shall bring out the current status of the problem, clearly indicating the shortcomings and gaps in the investigation carried out so far. 3

Evaluation

Students shall prepare a properly formatted seminar report giving all of the above details. They need to present the work carried out at the end of the semester. Credits will be awarded based on the viva-voce during the presentation and the content and organization of the report.

Course Outcomes

- CO1: Identify appropriate journals/conferences related to a topic of research interest and conduct literature review
- CO2: Develop awareness of the recent trends in the topic of investigation
- CO3: Write technical reports in prescribed formats
- CO4: Identify research gaps and formulate a valid research problem worthy of publishing in reputed journals

25TF682 Advanced Thermal & Fluids Eng. Lab

L	T	P	C
1	0	3	2

Dynamics similarity and scaling; Types of measurement devices & techniques; Errors in Measurement and its Analysis: Causes and types of experimental errors, systematic and random errors; Uncertainty analysis, computation of overall uncertainty, calibration.

Experiments in Wind Tunnel: Surface pressure distribution on circular cylinder, symmetric and cambered aero-foils-estimation lift and drag, smoke flow visualization. Laminar turbulent transition for various geometries.

Experiments in Water Channel: Visualization of flow over streamline and bluff bodies vortex shedding from bluff bodies (like circular cylinder)-study of vortex streets.

2-D laminar flow over bluff bodies (Hele-Shaw flow)-construction of flow net (velocity potential lines and streamlines). Numerical visualization of flow over bluff bodies using Ansys/Algor Software-comparison of numerical flow patterns with experimental ones.

Performance characteristics of Centrifugal compressor and axial flow fan.

Free Convection Heat Transfer- Forced Convection Heat Transfer- Measuring instruments for R&A/ Applications- measurement of very low temperature- Measurement of density and viscosity of fluids- measurement of gas flow rate through pipelines.

Steady state and transient convective heat transfer.

Radiation Heat Transfer - Boiling Heat Transfer- Performance evaluation of vapour compression refrigeration- performance evaluation of thermoelectric refrigerator and heat pump- Measurement and analysis of combustion parameters in I.C. Engines- Evaluation of the calorific value of gaseous and liquid fuels.

Experiments in supersonic jet: static pressure distribution in the nozzle wall, estimation of Mach number.

Experiments in pneumatic and hydraulic systems

TEXTBOOKS/REFERENCES

- [5] Barlow Jewel B., Rae William H., Pope Alan, Low speed wind tunnel testing, 3e, Wiley, 1999.

Course Outcomes

CO1: Develop physical insight into the advanced concepts in fluids and thermal engineering.

CO2: Design experiments to estimate physical variables involved in fluid flow and heat transfer.

- CO3: Conduct research studies in fluid flow and heat transfer.
 CO4: To have practical exposure to flow visualization techniques.

23HU611

Career Competency II

L	T	P	C
0	0	3	1

Soft Skills

Interpersonal skill: Ability to manage conflict, flexibility, empathetic listening, assertiveness, stress management, problem solving, understanding one's own interpersonal needs, role of effective team work in organizations

Group problem solving: The process, the challenges, the skills and knowledge required for the same.

Conflict management: The concept, its impact and importance in personal and professional lives, (activity to identify personal style of conflict management, developing insights that helps in future conflict management situations.)

Team building and working effectively in teams: The concept of groups (teams), different stages of group formation, process of team building, group dynamics, characteristics of effective team, role of leadership in team effectiveness. (Exercise to demonstrate the process of emergence of leadership in a group, debrief and reflection), group discussions.

Interview skills: what is the purpose of a job interview, types of job interviews, how to prepare for an interview, dos and don'ts of interview, One on one mock interview sessions with each student.

Verbal

Vocabulary: Help students understand the usage of words in different contexts. Stress the importance of using refined language through idioms and phrasal verbs.

Grammar: Enable students to identify poorly constructed sentences or incorrect sentences and improvise or correct them.

Reasoning: Facilitate the student to tap her/his reasoning skills through critical reasoning questions and logical ordering of sentences.

Reading Comprehension: Enlighten students on the different strategies involved in tackling reading comprehension questions.

Public Speaking Skills: Empower students to overcome glossophobia and speak effectively and confidently before an audience.

Writing Skills: Practice closet tests that assess basic knowledge and skills in usage and mechanics of writing such as punctuation, basic grammar and usage, sentence structure and rhetorical skills such as writing strategy, organization, and style.

Aptitude

Sequence and Series: Basics, AP, GP, HP, and Special Series.

Geometry: 2D, 3D, Coordinate Geometry, and Heights & Distance.

Permutations & Combinations: Basics, Fundamental Counting Principle, Circular Arrangements, and Derangements.

Probability: Basics, Addition & Multiplication Theorems, Conditional Probability and Bayes' Theorem.

Logical Reasoning I: Arrangements, Sequencing, Scheduling, Venn Diagram, Network Diagrams, Binary Logic, and Logical Connectives, Clocks, Calendars, Cubes, Non-Verbal reasoning and Symbol based reasoning.

Logical Reasoning II: Blood Relations, Direction Test, Syllogisms, Series, Odd man out, Coding & Decoding, Cryptarithmic Problems and Input - Output Reasoning.

Data Sufficiency: Introduction, 5 Options Data Sufficiency and 4 Options Data Sufficiency.

Campus recruitment papers: Discussion of previous year question papers of all major recruiters of Amrita Vishwa Vidyapeetham.

Miscellaneous: Interview Puzzles, Calculation Techniques and Time Management Strategies.

Course Outcomes:

CO1:**Soft Skills** - To demonstrate good interpersonal skills, solve problems and effectively participate in group discussions.

CO2:**Soft Skills** - To write technical resume and perform effectively in interviews.

CO3:**Aptitude** - To identify, investigate and arrive at appropriate strategies to solve questions on arithmetic by managing time effectively.

CO4:**Aptitude** - To investigate, understand and use appropriate techniques to solve questions on logical

reasoning and data analysis by managing time effectively.

CO5:Verbal - To be able to use diction that is more refined and appropriate and to be competent in knowledge of grammar to correct/improve sentences.

CO6:Verbal - To be able to examine, interpret and investigate passages and to be able to generate ideas, structure them logically and express them in a style that is comprehensible to the audience/recipient.

25TF698

Industry Internship

L	T	P	C
0	0	2	1

Students shall visit industrial units connected with their curriculum and conduct a detailed study on thermo-fluid systems pertinent to the industry visited and present reports. They are encouraged to solve a practical problem related to the industry. At the end of the training student should submit a report and certificate of completion to the department in the prescribed format.

Evaluation

This course is mandatory. The student shall make a report. The committee constituted by the department will assess the student based on the report submitted

Course Outcomes

- CO1: Familiarize with the industry environment/Research Laboratory
- CO2: Understand the application of theoretical concepts in a practical setting.
- CO3: Prepare technical documents/presentations related to the work completed

Third Semester

25TF798

Dissertation–Stage I

L	T	P	C
0	0	22	11

Dissertation (stage-1) should be based on the area in which the candidate has undertaken the dissertation work as per the common instructions for all branches of M.Tech. The examinations shall consist of the preparation of a report consisting of a detailed problem statement, literature review and initial results of the problem. The work has to be presented in front of the examiners consisting of Head of the Department and PG coordinator/Faculty Advisor and other invited faculty members (if any). The candidate has to be in regular contact with his guide and the topic of dissertation must be mutually decided by the guide and student.

Course Outcomes

- CO1: Identify appropriate methodology to solve a research problem
- CO2: Execute their research investigation adopting the chosen methodology and obtain results
- CO3: Write a technical report in a prescribed format.

Fourth Semester

25TF799

Dissertation–StageII

L	T	P	C
0	0	30	15

Dissertation(Stage-2)willstartinsemesterIVwhichisexpectedtobecontinuationofDissertation-1. In this phase of the project, students are expected to do the remaining part of their works done in stage-1. To particularly note, this phase of the project involves detailed data acquisition and subsequent analysis of the research problem. The dissertation should be presented in standard format as provided by the department/guide. The candidate has to prepare a detailed project report consisting of introduction of the problem, problem statement, literature review, objectives of the work, details of methodology adopted (experimental/numerical/analytical) and results and discussion. The report must bring out the conclusions of the work and future scope for study. The work has to be presented before the panel of examiners consisting of an approved external examiner, internal examiner/guide as decided by the department head and PG coordinator /faculty advisor. The candidate has to be in regular contact with his/her guide throughout the project duration. All the students are expected to publish their works in reputed journals/conferences (Scopus-indexed).

Course Outcomes

- CO1: Carry out detailed analysis of research data acquired through experimental/numerical/analytical methodologies in the context of the existing literature and draw valid conclusions thereof.
- CO2: Write the project reports systematically in a prescribed format.
- CO3: Write research articles worthy of publishing in reputed journals/conferences (SCI-indexed/Scopus-indexed)

ELECTIVES(I&II)

FluidStream

25TF631

Aerodynamics

L	T	P	C
3	0	0	3

Module-1

Basics equations of Fluid Mechanics, Potential flows, Stream function, Velocity potential, Two-dimensional incompressible flows: Laplace's equation, its solutions, Elementary potential flows, Superposition principle, the combination of elementary potential flows, conformal mapping. Implementation of conformal mapping textbook problems with the help of python/Matlab programming.

Module-2

Boundary layer: Laminar and Turbulent boundary layers: characteristics and factors causing separation, Effect of boundary layer separation on flow over airfoils. Introduction to bluff body aerodynamics: flow over circular cylinders, effect of Reynolds number and geometry, dynamic effects. vortex shedding: modes and mechanisms, Strouhal number, aerodynamic coefficients, span-wise correlation. Implementing the concepts in real-life aerodynamic problems using CFD simulations or experimental techniques.

Module-3

Flow over aerofoils: Conformal transformation, thin airfoil theory, forces on airfoils, Kutta condition, Generation of circulation, Lift of Zhukhovskiy airfoil. Introduction to finite wings: Prandtl's lifting line theory. Propulsion of fishes and flight of birds. Experimental aerodynamics: flow visualization techniques – PIV, LDV, Hydrogen Bubble Visualization, other techniques. Measurements – PIV, Hot wire anemometer, Cobra probe, Pressure transducers, force balances.

TEXTBOOKS/REFERENCES

- [1] Anderson J.D. Fundamentals of Aerodynamics, McGraw-Hill, 2017.
- [2] McCormick B.K. Aerodynamics, Aeronautics and Flight Mechanics, John Wiley and Son Inc., 1994.
- [3] Zdravkovich, M.M., 1997. Flow Around Circular Cylinders, Vol. 1: Fundamentals. Oxford University Press, Oxford, England.

- [5] Schlichting, H. and Gersten, K., Boundary Layer Theory, Springer-Verlag, 2004.
- [6] Fluid Mechanics Measurements, Richard J. Glodstien., 2nd Edition (2017), Taylor and Francis.

Course Outcomes

CO1: Development of insight into the fundamental concepts and write the equations governing the fluid flow.
CO2: Gaining conceptual understanding of Stream function, velocity potential solutions to Laplace's equation and to know the conditions under which potential-flow theory hold.

CO3: Skill to use superposition to build simple potential flows and to understand the concept of conformal mapping and its applications.

CO4: Acquiring knowledge on aerofoil nomenclature & characteristics and the Prandtl's lifting line theory and to do practical problems based on this theory.

CO5: Become knowledgeable of bluff body aerodynamics: flow separation, unsteady wake characteristics, experimental and numerical methods to investigate bluff body problems.

25TF632

Bio-fluid mechanics

L	T	P	C
3	0	0	3

Module-1

Review of Concepts in Fluid Mechanics, Kinematics, Hydrostatics, Conservation relations, Viscous Flow, Unsteady Flow; Review of Concepts in Solid Mechanics.

Heart: Anatomy, Cardiac cycle, circulatory systems, pressure, flow chamber volume and work, Cardiac Muscle, Heart Sounds, Coronary

Circulation, Cardiac Conduction, ECG and Wiggers diagram.

Hemodynamics: Hematology and Blood Rheology, Composition of Blood, Viscosity of Blood, Constitutive equations, Power Law Model, Herschel-Bulkley Model, Casson Model, Fahraeus and Fahraeus-Lindqvist Effects, Effective viscosity.

Arterial system: Structure of Arteries, Venous System Physiology, Venous Pump, Mechanics of Arterial Walls, Compliance.

Module-2

Macrocirculation System: Systemic and Pulmonary circulations, Arteries, Veins, Vascular Bifurcations and Branches, Blood Flow through Curved Vessels. Steady Blood Flow, Applications of Bernoulli equation, Arterial Stenosis, Arterial Aneurysm, Cerebral Aneurysm, Cardiac Valve Stenosis, Applications of Poiseuille's Law, Gorlin equation, Fluid friction, Rigid Tube Flow Models, Entrance Length, Transition Reynolds number, Casson model steady blood flow. Unsteady blood flow, Windkessel model, Continuum Models for Pulsatile Flow Dynamics, Wave Propagation in the Arterial System; Pulsatile Flow in Rigid Tubes: Womersley Solution, Fry Solution; Hemodynamic Theories of Atherogenesis, Flow through Curved Arteries, Bifurcations, Stenoses and Aneurysms; Effect of Viscoelasticity of Tube Material; Flow in Collapsible Tubes, Turbulence, Instability

in Pulsatile Flow. Microcirculation System: Blood flow in small vessels, Arterioles, Capillaries, interstitial fluid flow; Venules, Mass Transport in Tissue, Krogh model of oxygen diffusion, Porosity, Tortuosity and Permeability, Governing Equations in Porous Media, Fluid Transport in Poroelastic Media, Bioheat Transfer.

Module-3

Biofluid Dynamics in Human Organs: Lung and Respiratory System, Kidney, Liver, Brain, Intraocular System, Endocrine System Biofluids.

Native Heart Valves: Aortic and Pulmonary Valves, Mitral and Tricuspid Valves.

Biofluid Flow in Artificial, Assistive and Implantable Devices, Lumped Parameter Mathematical Models. Computational Fluid Dynamic Analysis of the Human Circulation: Modelling Considerations for Biofluid Mechanical Simulations, Generation of grid from scanned images, CFD Simulations in the Human Circulation, Multiscale Modelling. Fluid Structure Interaction Modelling, Future Directions of Biofluid Mechanics.

- [6] Y Cengel and J Cimbala, Fluid Mechanics: Fundamentals and Applications, 4e, McGraw-Hill, 2018.

Course Outcomes

CO1: Fluid and solid mechanics that are pertinent to blood flow in the heart and blood

vessels. CO2: Hematology, Blood Rheology and models for Viscosity of Blood, Structure of Arteries and Veins.

CO3: Microcirculation System, interstitial fluid flow, mass and heat transport biofluid Dynamics in Human Organs,

CO4: Analysis of blood flow in Native Heart Valves and Implantable Devices

CO5: Computational Fluid Dynamic Analysis of the Human Circulation Fluid Structure Interaction Modelling

Module-1

Introduction: Ideal and real fluids, Boundary-Layer concept, Laminar boundary layer, turbulent boundary layer, Separation of boundary layer, Navier- Stokes equations, Laminar Boundary

Layer Equation: Two dimensional equations, displacement and momentum thickness, general properties of the boundary layer equations, wall friction, drag and lift.

Module-2

Boundary layer on an airfoil. Boundary layer control, Continuous suction and blowing. Solution of the boundary layer equation (Plane flows): Similarity Solutions, Boundary layer with and without outer flow, moving plate, Wedge flow, Free jet, Flows in straight channel. Approximate Methods, Momentum-Integral methods. Numerical integration of boundary layer equations.

Module-3

Turbulent Boundary Layer: Mean motion and fluctuations, Equations for turbulent flows, Prandtl's mixing layer Karman's hypothesis. Thermal Boundary Layers: Effect of Prandtl Number, Similar solution of thermal boundary layer, Integral method for computing heat transfer, Coupling of the velocity field to the temperature field. Boundary layer in non-Newtonian flows, Boundary layer in Magnetohydrodynamics.

Separation in adverse pressure gradients. Concept of and occurrence in steady flows, and at rear stagnation point of impulsively started cylinder. Form of skin friction near separation point: Goldstein singularity.

Introduction to interactive boundary layers. Goldstein near wake. Trailing-edge triple deck.

TEXTBOOKS/REFERENCES

- [6] Kays, W.M., Crawford, M.E., and Weigand, B., Convective Heat and Mass Transfer, 4th Ed., McGraw Hill, 2004

Course Outcomes

CO1: Understand the concept of hydrodynamic boundary layer and derive the boundary layer equations.

CO2: Identify the effective method for boundary layer control and apply the appropriate method for optimized design.

CO3: Understand the concept of thermal boundary layer and its control.

Module-1

Introduction to bluff body flows: factors influencing bluff body flows – boundary layer – flow separation – wake formation-vortex shedding. Flow over stationary isolated circular cylinder: classification of flow regimes based on Re – Laminar states of flow – steady laminar wake- periodic laminar regime, Turbulent states of flow: Transition in wake (TrW) – Transition in shear layers (TrSL) – Transition in boundary layers (TrBL) – Fully Turbulent flow state (T). Vortex shedding: Strouhal number-mechanism-span wise correlation – vortex street formation- mathematical models. Induced forces (lift and drag): effect of Re- flow incidence angle-body surface texture- blockage-free stream turbulence.

Flow over non-circular cylinders – Influence of geometry and Re- flow separation- wake structures – vortex shedding and induced forces. FSI in biological systems: blood flow through arteries and veins- diagnosis of diseases.

Module-2

Flow interference between two circular cylinders – tandem, side-by-side and staggered arrangements - classification of interference regimes – effect of spacing - flow patterns and surface pressure distribution - biased gap flow - induced forces (lift & drag). Flow over cylinder clusters (multiple cylinders).

Flow interference between non-circular cylinders - influence of Re - body geometry – spacing – differences and similarities with circular cylinders.

Module-3

Flow-induced vibrations (FIV): Influencing factors – body geometry-reduced velocity - free stream turbulence – flow incidence – mass ratio – damping – added mass. Vortex-induced vibration-galloping-flutter-fluid elastic excitation-turbulence buffeting-other types. Flow structures around oscillating cylinders-induced forces and cylinder response-equations of motion-modal analysis, Interference effects in FIV.

Some practical problems: Tube bundle vibrations in heat exchangers and nuclear reactors- Vibrations of stacks and other tall structures, transmission line vibrations. Passive and active control of FIV. Energy extraction from FIV. FIV in Engineering Codes. Experimental measurements, flow visualization techniques

TEXTBOOKS/REFERENCES

- [5] Thomson, W.T and Dahleh, M.D., Theory of vibrations with Applications, Prentice Hall, 1997.
- [6] Rao, S.S., Mechanical Vibrations, Pearson Education, 2004.

Course Outcomes

- CO1: Develop fundamental knowledge in FSI
- CO2: Development of capability to analyse fluid flows of different types associated with different engineering situations involving FSI
- CO3: Develop skill to propose solutions to FSI problems and cater to industrial needs
- CO4: Academic capability to conduct research activities in the area of FSI.

25TF635	Introduction to Turbulence	L	T	P	C
		3	0	0	3

Module-1

Origin, examples and character of turbulence, Reynolds stress, energy relations, closure problem, phenomenology, eddy viscosity. Statistics, Spectra, space-time correlations, macro & micro scales, statistical theory of turbulence, locally isotropic turbulence, Kolmogorov’s hypothesis, correlation method, spectral method, turbulence diffusion.

Module-2

Numerical Turbulence modelling: Reynolds averaging technique, Reynolds stress, RANS model, one-, two- and multiple equations for turbulence modelling, Spalart-Allmaras model, k-epsilon models, k-omega models, SST k-omega models and RSM. Introduction to Large eddy simulation (LES) and Direct Numerical Simulation (DNS) method. Implementation and verification of the different turbulent models in real-life turbulent flow problems using CFD software.

Module-3

Experimental techniques: Hot Wire Anemometer, Laser Doppler Anemometer, Flow visualization techniques, laminar-turbulent transition. Relaminarization.

TEXTBOOKS/REFERENCES

- [1] Tennekes H. and Lumley J.L., A first course in Turbulence, MIT Press, USA, 1972.
- [2] Stephen. B. Pope, Turbulent Flows, Cambridge University Press, UK, 2000.

- [5] Schlichting, H., and Gersten, K., 2000, Boundary Layer Theory, Springer.
- [6] Wilcox, D.C., 2010, Turbulence Modelling for CFD, DCW Industries, California, USA.

Course Outcomes

- CO1: To understand the concept and origin of turbulence and the fundamental characteristics of turbulent flows
- CO2: To study the concept of closure problem, energy spectra, eddy viscosity, Reynolds stress etc.
- CO3: To understand the concept of statistical turbulence, Kolmogorov's hypothesis, space-time correlation methods, spectral methods etc.
- CO4: To understand concept time, space and ensemble averaging, Numerical Turbulence modelling, one-, two- and multiple equations for turbulence modelling, RSM, LES and DNS methods
- CO5: To study experimental measurement of turbulence such as hot wire anemometer, laser Doppler anemometer etc.

Thermal Stream Electives

25TF641	Computational methods for Micro and Nano Scale Thermal Systems	L	T	P	C
		3	0	0	3

Module-1

Introduction: Computational simulation, need for discrete computation.

Classical Mechanics: Mechanics of Particles, D'Alembert's principle and Lagrange's equation, variational principles, Hamilton's principle, conservation theorems and symmetry properties, central force problems, virial theorem.

Module-2

Statistical Mechanics: Review of probability and statistics, quantum states of a system, equations of state, canonical and microcanonical ensemble, partition function, energy levels for molecules, equipartition theorem, minimizing the free energy, partition function for identical particles, Maxwell distribution of molecular speeds.

Module-3

Molecular dynamics: basic machinery, running, measuring, and analyzing, interatomic potentials, LAMMPS, Examples.

Introduction

to Multiscale methods and applications. Introduction to Data driven modeling and scientific computation.

TEXTBOOKS/REFERENCES

Course Outcomes

CO1: To gain knowledge on fundamental topics like classical mechanics and statistical mechanics. CO2: Have exposure about atomistic simulation techniques and its applications.

CO3: Develop molecular dynamics simulations for a given application using LAMMPS

CO4: Have exposure about multiscale simulation methods.

CO5: Apply data driven science techniques for analysis and design.

25TF642

Cryogenics

L	T	P	C
3	0	0	3

Module-1

Introduction to Cryogenic Systems: Historical development, Applications of Cryogenics (Space, Food Processing, Superconductivity, Electrical Power, Biology, Medicine, Electronics and Cutting Tool Industry).

Low Temperature Properties: Properties of Engineering Materials (Mechanical properties, Thermal properties, Electric and Magnetic properties), Properties of Cryogenic fluids.

Module-2

Introduction to Liquefaction Systems: Ideal system, Liquefaction systems for Neon, Hydrogen and Helium. Critical components of liquefaction systems, Joule Thomson expansion, Adiabatic expansion, Linde Hampson Cycle, Claude & Cascaded System. Introduction to Cryogenic Refrigeration Systems: Magnetic Cooling, Stirling Cycle, Cryo Coolers.

Module-3

Cryogenic Fluid Storage and Transfer Systems: Cryogenic storage vessels and transportation. Thermal insulation and their performance at cryogenic temperatures, Super insulations, Vacuum insulation, Powder insulation. Thermal stratification, Cryogenic fluid transfer systems. Cryogenic engine injectors (subcritical & super critical) Cryogenic Instrumentation: Pressure, flow-rate, liquid-level and temperature measurements. Types of Heat Exchangers used in cryogenic systems. Cryo Pumping Applications.

TEXTBOOKS/REFERENCES

- [6] Klaus D. Timmerhaus and Thomas M. Flynn, Cryogenic Process Engineering, Plenum Press, New York, 1989.

Course Outcomes

CO1: Understand properties of material at cryogenic

temperatures. CO2: Know about various liquefaction systems

CO3: Get idea on cryogenic refrigeration systems, cryogenic instrumentation and cryogenic heat exchangers

25TF643 HeatExchangeEquipment

L	T	P	C
3	0	0	3

Module-1

Introduction: Classification of heat exchangers, design of heat exchangers: engineering design-steps for designing, design a workable system, optimum systems, economics, probabilistic approach to design, sizing and rating problems; LMTD and ϵ -NTU approach of design. Introduction to design codes (ASME, TEMA, HTRI etc)

Design of double pipe heat exchangers: introduction, basic design procedure and theory, overall heat transfer coefficient, fouling factors, fins, weighted fin efficiency, pressure drop analysis, design problems. Introduction to three fluid/ multifluid heat exchanger behaviour.

Design of shell and tube heat exchangers – basic design procedure and theory, shell and tube exchangers: construction details, general design considerations: fluid allocation, shell and tube fluid velocities, tube-side and shell side heat-transfer coefficient and pressure drop, Kern's method, design problems.

Module-2

Design of Condenser; Heat-transfer fundamentals, Condensation of steam, Condensation inside and outside horizontal tubes, Condensation inside and outside vertical tubes, De-superheating and sub-cooling, Pressure drop in condensers, design problems.

Design of Compact heat exchanger: introduction, design procedure of compact heat exchanger, pressure drop analysis of plate fin heat exchanger, problems. Plate heat exchanger: Gasketed plate heat exchangers, Welded plate, advantages and disadvantages over the other heat exchangers, design procedure, heat transfer coefficient and pressure drop calculation on both the sides of exchanger, problems on plate exchanger.

Module-3

Thermal design of heat exchanger such as Regenerative heat exchanger, Super heater, Air pre-heaters, analysis and design of cooling towers.

Heat pipe: introduction, working principle, working fluids, wick structure and material, classification of heat pipe, pressure variation along the heat pipe, limitations of a heat pipe, problems on heat pipe.

TEXTBOOKS/REFERENCES

- [4] Coulson & Richardson's series, Sinnott R.K., Chemical Engineering Design, Elsevier, 2005
- [5] Kays W M and London A L, Compact Heat Exchanger, Krieger Publishing Company, 1998

Course Outcomes

CO1: Background, Application, Classification and Common terminologies of Heat exchangers
CO2: Design of Tubular Heat Exchangers
CO3: Design of Regenerative and Compact Heat exchangers
CO4: Design concepts of Heat Pipes.

25TF644	HVAC and Refrigeration	L	T	P	C
		3	0	0	3

Module-1

History of refrigeration, Refrigeration cycles: vapour compression cycle and vapour absorption systems. Thermodynamic analysis of cycles. System components: Refrigerant Compressors - Reciprocating, Hermetic, Rotary, Centrifugal Scroll Compressors - Comparison, Construction and Operation characteristics. Evaporators - DX coil, flooded type Chillers, Condensing Units and Cooling Towers.

Module-2

Refrigerants: Desirable properties, Classification, Designation, Alternate Refrigerants, Global Warming Potential & Ozone Depleting Potential aspects. Expansion devices: Automatic Expansion Valves, Capillary Tube & Thermostatic Expansion Valves. Cycling controls and system balancing: Pressure and Temperature controls, Range and Differential settings. Selection and balancing of system components - Graphical method.

Module-3

Psychrometry: Moist air behaviour - Psychrometric chart - Different Psychrometric process and their analysis. Air conditioning: Summer and Winter Air conditioning - Cooling Load Calculations - Air Distribution Patterns - Dynamic and Frictional Losses in Air Ducts - Equal Friction Method - Fan Characteristics in Duct Systems.

TEXTBOOKS/REFERENCES

- [2] Stocker W.F. and Jones J.W. Refrigeration & Air Conditioning - McGraw Hill, 1985.
- [3] Dossat R.J. Principles of Refrigeration, John Wiley, 1989.
- [4] Goshnay W.B. Principles and Refrigeration, Cambridge University Press, 1982.

Course Outcomes

CO1: Identify the suitability of refrigeration systems

CO2: Select refrigerants and components like evaporator, compressor, condenser, expansion device etc. based on operational characteristics

CO3: Design of refrigeration and air-

conditioning systems using fundamental of heat and mass transfer principles

CO4: Evaluate the performance of an air-conditioning

system CO5: Estimate cooling/heating load for given application

25TF645	IC Engine Systems, Combustion and Emissions	L	T	P	C
		3	0	0	3

Module-1

Constructional features of different types of internal combustion engines, SI Engine introduction, carburetion mixture requirements, Fuel supply. Thermo-chemistry and thermodynamics of combustion, Laminar and turbulent premixed flames, Premixed engine combustion, Ignition, Stages of combustion, Normal and abnormal combustion, factors affecting knock, Combustion chambers.

Module-2

CI engine, Injection Systems, Spray formation and atomization, Combustion systems and management, Mechanical and electronic-Combustion in CI engines-stages of combustion-Factors affecting combustion, Direct and indirect injection systems. Introduction to Turbo charging and supercharging. Basic concepts of engine simulation, governing equations, simulation of various engine processes for SI and CI Engines. Alternate fuels for SI and CI Engines.

Module-3

Chemical equilibrium analysis (BOL and EOL), Application of NACA-CEA code.

Introduction to air pollutants and pollution; Genesis and formation of engine emissions, NO kinetics, Soot formation and oxidation, NO_x-Soot trade off. Control of emissions in SI and CI engines, Impact of engine design parameters on emissions, exhaust after treatment, lean de-NO_x catalysts.

TEXTBOOKS/REFERENCES

- [6] Gupta H.N., Fundamentals of Internal Combustion Engines, PHI Learning Pvt. Ltd., 2006.

Course Outcomes

CO1: Understand the constructional features and systems of different types of internal combustion engines.
 CO2: Understand basic concepts of engine simulation and performance optimization.
 CO3: To familiarize the mechanism of combustion, pollutant formation and its control.

25TF646	Inverse Heat Transfer	L	T	P	C
		3	0	0	3

Module-1

Inverse heat transfer problem concept, Convex and non-convex functions, Fundamentals of nature of solutions of mathematical models, Well and ill-posed problems, Regularization, Conditional probability, Baye's theorem, conditional independence, Naïve Bayes.

Module-2

Linear and non-linear optimisation problems, Parameter estimation, Gradient descend methods, Levenberg-Marquard method, Conjugate gradient method, Adjoint problem. Review of governing equations of heat transfer and fluid flow problems, inverse problems, examples, Methods of design of experiments
 Differential Evolution Techniques' (genetical algorithm based).

Module-3

Deterministic, heuristic, and hybrid methods for Single-Objective optimization and response surface generation, Adjoint methods, Bayesian approaches for the solution of inverse problems, Low-order models and their use for solving inverse boundary problems, Data, Noise, and Model reduction in inverse problems, Applications.

TEXTBOOKS/REFERENCES

- [1] Ozisik, M.N. and Orlande, H.R., Inverse heat transfer: fundamentals and applications. CRC press, 2021

- [3] Orlande, Helcio R.B., Inverse heat transfer: fundamentals and applications. CRC Press, 2021
- [4] Beck, James Vere, and Kenneth J. Arnold. Parameter estimation in engineering and science. James Beck, 1977.

Course Outcomes

- CO1: Capability to understand mathematical background of inverse problems.
- CO2: Capability to understand the nature of mathematical models and methods to solve them
- CO3: Capability to convert parameter estimation problems into optimization problems and solve them.
- CO4: Capability to formulate inverse problems in heat transfer and select appropriate method to solve.
- CO5: Capability of identify research problems in design of systems involving heat transfer.

25TF647	Micro and Nano Scale Thermal Engineering	L	T	P	C
----------------	---	----------	----------	----------	----------

Module1

Physics of miniaturisation – scaling laws.

Microscale Energy Transport in Solids: Microstructure of solids, crystal vibrations and phonons, photon interactions, particle transport theories, non-equilibrium energy transfer.

Molecular Forces and Phase Change in Thin Liquid Films: Thermodynamics of thin films, interfacial meniscus properties, interfacial mass flux.

Heat Transfer and Pressure Drops in Microchannels: Single phase and two phase flow, flow boiling, dryout, bubble behaviour, flow pattern.

Module2

Microfluidics: Introduction, continuum assumption, pressure driven microflows, boundary condition in fluid mechanics, surface tension driven flows, Electrokinetic Flows.

Nanofluidics: Simple Fluids in Nanochannels, Water in nanochannels, nanofluidic energy conversion.

Module3

Micro Heat Pipes: Fundamental operating principles, steady state and transient modeling and construction techniques.

Microscale Thermal Sensors and Actuators: MEMS technology, flow sensors, infrared radiation detectors, thermal conductivity sensor, thermal expansion actuators and micro-steam engine. Nanofluids: Preparation of nano-fluids, sputtering, characterization of nano-fluids, thermal properties of nano-fluids, single phase convective and boiling heat transfer processes.

Drug delivery, lab on chip devices, BioMEMS.

TEXTBOOKS/REFERENCES

- [6] Kirby, B.J., Micro- and Nanoscale Fluid Mechanics: Transport in Microfluidic Devices, Cambridge University Press, 2010

Course Outcomes

CO1: To familiarise with the scaling of forces with system size and the associated changes in the physical behavior of micro/nano scale systems.

CO2: To gain a fundamental understanding about the thermal transport in micro/nano scale systems.

CO3: To familiarise with methods used for analysing fluid transport in micro/nano scale systems.

CO4: To identify, formulate, and solve interdisciplinary problems relevant for micro and nano scale thermal and fluid systems.

25TF648	Two-phase Flow and Heat Transfer	L	T	P	C
		3	0	0	3

Module-1

Introduction to phase change flow and heat transfer technology, Various industrial applications, Review of one-dimensional conservation equations in single phase flows, Types of flow, volumetric concentration, void fraction, volumetric flux, relative velocity, drift velocity, flow regimes, flow pattern maps, analytical models.

Interfacial tension, wetting phenomenon and contact angles, Phase stability and nucleation.

Homogeneous Flow: One dimensional steady homogeneous equilibrium flow, homogeneous friction factor, turbulent flow friction factor.

Module-2

Separated Flow: Slip, Lockhart-Martinelli method for pressure drop calculation, pressure drop for flow with boiling, flow with phase change.

Drift Flow Model: General theory, gravity flows with no wall shear, correction to simple theory, Armandor Bankoff flow parameters.

Boiling: Thermodynamics of boiling, Regimes of boiling, nucleation and dynamics of bubbles, gas nucleation in bulk liquid, growth of bubbles, motion at a heating surface, heat transfer rates in pool boiling, critical heat flux in pool boiling, forced convection boiling, critical heat flux in forced convection boiling, minimum heat flux, film boiling, post-dryout heat transfer, heat transfer correlations, boiling of metals. Flow instabilities, choking in two-phase flow.

Module-3

Condensation: Nusselt theory, Film and drop-wise condensation, boundary layer treatment of laminar film condensation, condensation in vertical and horizontal tubes, condensation inside a horizontal tube.

Signal Analysis, Two Fluid-Population Balance Technique, Volume of Fluid Method, Lattice-Boltzmann Model, Smoothed Particle Hydrodynamics.

Molecular Dynamics: Boiling, Condensation, Solid-Liquid Flow, Gas-Solid-Flow.

TEXTBOOKS/REFERENCES

- [1] Ishii, M. and Hibiki, T., Thermo-fluid Dynamics of Two-Phase Flow, Springer. 2009.
- [2] Collier, J. G. and Thome, J. R., Convective Boiling and Condensation, Oxford University Press, 1996
- [3] Brennen, C. E., Fundamentals of Multiphase Flow, Cambridge University Press. 2009.

- [5] Ghiaasiaan, S. M., Two-Phase flow, Boiling, and Condensation”, 2nd edition, 2017, Cambridge University Press
- [6] Graham B Wallis, One dimensional two phase flow, McGraw Hill, 1969.

Course Outcomes

- CO1: Describe the most important phenomena and principles of two-phase flow in engineering applications
- CO2: Apply the basic two-phase models and flow pattern maps to calculate the pressure drop of two-phase flow at various conditions.
- CO3: Explain the main points of boiling and condensation, heat transfer, and their enhancement methods
- CO4: Describe the concept of boiling crisis (e.g., DNB- departure from nucleate boiling, and dryout) and its modelling
- CO5: Apply the models of critical flow and flooding to analyze limiting flow of engineering processes.
- CO6: Understand the current status to write a scientific review for a topic in the field of two-phase flow and heat transfer and identify a problem for research

Automation, AI and Energy Systems

25TF651 Fuel Cell Technology and Hydrogen Energy

L	T	P	C
3	0	0	3

Module-1

Overview of Fuel Cells, Fuel Cell performance. Low and high temperature fuel cells, Polymerelectrolyte fuel cells, Alkaline fuel cells, Phosphoric fuel cells, Molten carbonate fuel cells, Solidoxide fuel cells, Fuel Cell thermodynamics, Fuel Cell Efficiency, Fuel Cell Electrochemistry, Fuelcell reaction kinetics- electrode kinetics, CurrentPotential Relationship, Sensitivity of Parametersinpolarization curve.

Module-2

Cell components, Materials Properties and Process: Membrane, Electrode, Gas Diffusion Layer,Bipolar Plates. Fuel cell Operating Conditions: Operating Pressure and Temperature, Reactant flowrates. Fuel Cell Mass and Energy Balance. Fuel Cell Modelling: Conservation of Mass, Momentum,Energy, Species and Charge. Sizing of Fuel Cell Stack, Stack configuration, Fuel cell systems andSamplecalculations.

Module-3

Hydrogen as a source of energy, physical and chemical properties, suitability of hydrogen as a fuel,salientcharacteristics, relevant issues and concerns.

Production of hydrogen, thermal-Steam reformation, gasification and woody biomass conversion,partial oxidation methods, biological hydrogen production, photo dissociation, direct thermal or cat-alyticsplittingofwater.

General storage methods, compressed storage-composite cylinders, metal hydride storage, carbonbasedmaterials forhydrogenstorage. Safetyaspectsof hydrogen storageand handling.

TEXTBOOKS/REFERENCES

- [6] TomorrowsEnergy:Hydrogen,Fuelcellsandtheprospectsforacleanerplanet,PeterHoffman,TheMITPress,Cambridge,London,England.

CourseOutcomes

CO1: Understand and apply the basic thermodynamic and electrochemistry to fuel cell

systems.CO2:Understandthe effectof operatingconditions onthe performanceofthefuel cell.

CO3:Studentsabletounderstandanddemonstratethehydrogenproductiontechnologies,storagemethodsand strategies for transition tohydrogen economy.

25TF652 Instrumentation and Process Control

L	T	P	C
3	0	0	3

Module-1

Instrumentation: Introduction: Measurement and its classification by physical characteristics, direct and inferential measurement, on-and off- line measurement.

Static Characteristics of Instruments: Error, accuracy, repeatability, drift, threshold, backlash, hysteresis, zero-stability, static, coulomb and viscous friction, live zero, suppressed zero, working bind.

Sensor and Transducers: Classification, principles and applications, interpretation of performance specification of transducers.

Building Blocks of an Instrument: Transducer, amplifier, signal conditioner, signal isolation, signal transmitter, display, data acquisition modules, I/O devices, interfaces. Process

Instrumentation: Working principles of transducers/instruments employed for the measurement of flow, level, pressure, temperature, density, viscosity, etc. and their merits and demerits.

Module-2

Data Acquisition and Signal Processing: Systems for data acquisition and processing, modules and computerized data system, digitization rate, time and frequency domain representation of signals, and Nyquist criterion; Introduction to LabView and Matlab for data capture and analysis.

Process Control: Introduction: The concept of process dynamics and control, review of Laplace transform methods, Laplace transform of disturbances and building functions, dynamic model building of simple systems.

Linear Open Loop System: Physical examples of first order systems and their response for step, impulse and sinusoidal inputs, linearization of nonlinear models, response of first order system in series, examples of second order systems and their response.

Linear Closed Loop System: The control system and its elements, closed loop transfer functions, transient response of simple control systems, concept of stability and use of Routh-Hurwitz test for stability.

Module-3

Controllers: Modes of control action, control system and its closed-loop transfer function.

Root Locus Method: Root locus treatment, response from root locus and its application to control system design.

Frequency Response: Introduction to frequency response, Bode diagrams of simple systems, Bode stability criterion, Control system design by frequency response, use of gain and phase margins.

Model predictive control, Batch Process control, Plant-wide control & monitoring, Plant-wide control design, Instrumentation for process monitoring, Statistical process control, Introduction to Fuzzy Logic in Process Control, Introduction to OPC, Introduction to environmental issues and sustainable development relating to process industries.

Process Automation, Role of digital computer system in process control, Distributed instrumentation and control system, PLC, DCS, SCADA.

- [6] Bequette B. W., Process Control – Modeling, Design and Simulation, Prentice-Hall of India. 2003

Course Outcomes

CO1: Understand basic principles and importance of process control in industrial process plants.
CO2: Study and estimate various characteristics of instruments
CO3: Analyse and design Linear Open and Closed Loop Systems

CO4: Controllers and Modes of control

CO5: Plant-wide monitoring & control

CO6: Process Automation and Distributed instrumentation and control system.

25TF653	Introduction to data-driven methods	L	T	P	C
		3	0	0	3

Module-1

Implementation of Linear Systems Revisited: Direct Solution Methods, Iterative Solution Methods, Gradient (Steepest) Descent, Eigenvalues, Eigenvectors and Solvability, Nonlinear Systems. Curve fitting: Least-Square Fitting Methods, Polynomial Fits and Splines. Singular Value Decomposition: Basics, Principal Component Analysis (PCA), Diagonalization, Proper orthogonal Modes. Dimensionality Reduction: POD for Partial differential equations, POD expansion, POD with symmetries.

Module-2

Dynamic mode decomposition (DMD): Introduction, Dynamics of DMD versus POD, Applications of DMD.

Data assimilation: Introduction and applications.

Equation free modelling: Multiscale physics, Lifting and Restricting in Equation-free

Computing. Module-3

Applications of POD and DMD for Thermal and Fluid systems: Introduction to coherent structures, Turbulence, Jet flows, boundary layer, flows in complex geometries, flows in internal combustion engines.

Course outcomes

CO1: To gain fundamental knowledge on the basic concepts and theoretical ideas in data-driven techniques in the context of programming language infrastructure.

CO2: To develop an understanding of the algorithms used for transforming and reducing data.

CO3: To implement the various theoretical and computational tools on scientific applications relevant for thermal and fluid systems.

25TF654	Machine Learning and Artificial Intelligence	L	T	P	C
		3	0	0	3

Module-1

Mathematical concept review: Linear algebra and Probability, Introduction to Machine learning, Terminologies in machine learning, Types of machine learning, Linear Regression, Multivariate Regression, Bias Variance, Classification of Linear models, Bayesian Classifiers.

Module-2

Regularization, Hyper-parameter Tuning, Subset selection, shrinkage method, Dimensionality Reduction, Evaluation measures, Decision trees, Ensemble models – Bagging and Boosting, Random Forest.

Module-3

Support Vector Machines - Large margin classifiers, Nonlinear SVM, kernel functions Hyperplane, Perceptron Learning, Unsupervised Learning Algorithms: Dimensionality Reduction- Principal Component Analysis (PCA), Clustering – Hierarchical, Partitioned clustering: K-means, Basics of Neural Network.

CO1: Develop a good understanding of fundamental principles of machine

learning. CO2: Formulation of a Machine Learning problem.

CO3: Develop a model using supervised/unsupervised machine learning algorithms for classification/prediction/clustering.

CO4: Evaluate performance of various machine learning algorithms on various datasets of a domain.

CO5: Design and Concrete implementations of various machine learning algorithms to solve a given problem using languages such as Python.

25TF655	Nuclear Reactor Thermal-Hydraulics and Safety	L	T	P	C
		3	0	0	3

Module 1

Basic concepts of reactor physics, radioactivity. Neutron Scattering. Thermal and fast reactors. Overview of nuclear reactor systems. Sources and distribution of thermal loads in nuclear power reactors.

Flow Regimes in Two-Phase Flow, Two-phase flow models: Homogeneous Equilibrium Model, Separated and Slip Flow Model, Void Fraction Correlations, Stratified Flow Analysis and Flow Pattern transition, Pool Boiling & Flow Boiling Heat Transfer, Critical Flow, Nuclear Applications of Fluid Mechanics and Heat Transfer.

Module 2

Heat generation in fuel, coolant, structural and shield materials and decay heat, Nuclear Heat Transport, steady and unsteady conduction in fuel, cladding, and structural materials elements, Multi-dimensional thermal-hydraulics in plenum.

Hydraulics of reactor system loops, Hydraulics of heated channels.

Thermal stratification, thermal shock, thermal fatigue, gas entrainment, steam-liquid droplet separation.

Safety philosophy, Thermal Design Principles, Single Channel Analysis, Sub-channel analysis, LOCA and LOFA Modelling, modelling of containment loading. Waste management. Indian nuclear power program.

Module3

NuclearInstrumentation,HealthPhysics,RadiationShielding.

ReviewofThermal-HydraulicsCodesUsedforReactorAccidentAnalysis,AdvancedSafetyConceptsand UpcomingReactor SafetyMethodsand next generationreactors.

Thermal-Hydraulics Uncertainty Analysis, Probabilistic safety assessment, regulatory procedureandlicensing.

CourseOutcomes

CO1:Applicationofreactorphysicsconceptsandworkingofthermalandfastreactors
CO2:Understanding of two-phase flows, boiling, condensation, Critical Heat Flux
CO3:Heatgeneration and transportinreactor
CO4:Thermalhydraulicphenomenainsidereactorvesselandcomponents
CO5:Safetyprinciples&safetyevaluation andLicencingaspects
CO6:AnalysisofTransientandAccidents

Module-1

Introduction & Economics: Energy scenario, Overview power plants, Types of power stations, Economy and thermal schemes of power stations. Review of various ideal cycles—Rankine and Brayton—and fuel-air cycles. Thermodynamics optimization of design parameters. Load curves, various terms and factors involved in power plant calculations. Effect of variable load on power plant operation, Selection of power plant units. Economics of plant selection, other considerations in plant selection.

Module-2

Coal based plants: Analysis of steam cycles, Feedwater heaters, Deaerator and drain cooler, Optimization of cycle parameters, reheat and regeneration, Analysis of multi-fluid coupled cycles, Co-generation of power and process heat. Thermal power plant equipment, Combustion mechanisms, Furnaces, Combustion control, boilers (coal based, RDF based), economizers, Feedwater treatment, feed water heater, Boiler maintenance, ash handling system, Dust collection system Operation and maintenance of steam power plant, heat balance and efficiency, Site selection of a steam power plant

Gas turbine plants: Layout of gas turbine power plant, Elements of gas turbine power plants, Gas turbine fuels, cogeneration, auxiliary systems such as fuel, controls and lubrication, operation and maintenance, Combined cycle power plants, Site selection of gas turbine power plant.

Module-3

Diesel based plants: General layout, Components of Diesel power plant, Performance of diesel power plant, fuel system, lubrication system, air intake and admission system, supercharging system, exhaust system, diesel plant operation and efficiency, heat balance, Site selection of diesel power plant, Comparative study of diesel power plant with steam power plant.

Nuclear based plants: Elements of nuclear power plants, nuclear reactors and fuels. New generation power plants.

Renewable energy: solar, geothermal, wind, biomass, ocean, fuel cells, Environmental aspects of power generation, sustainability and future scenarios.

Negative emission power plants: Introduction, thermodynamics, carbon capture and utilization, techno-economic aspects.

TEXTBOOKS/REFERENCES

- [1] Power Plant Engineering, P.K. Nag, McGraw-Hill Education
- [2] Power Plant Technology, M.M. El-Wakil, McGraw-Hill Education
- [3] Gas Turbines by V Ganeshan, McGraw Hill Education
- [4] Steam Turbine Theory and Practice, William J. Kearton, CBS Publication

[5] Suryanarayana, N. V., and Arici, O, Design and Simulation of Thermal Systems, McGraw Hill, 2001

Course Outcomes

CO1: Skill to identify suitable thermal plant for power generation based on techno-economic considerations.

CO2: Ability to do site selection for a power plant.

CO3: Ability to analyse the performance of thermal power plants.

CO4: Skill to suggest methods for improving the performance of power plants.

CO5: Skill to undertake research studies in conventional and non-conventional power plants

25TF657	Renewable Energy	L	T	P	C
		3	0	0	3

Module-1

Renewable energy sources in India - potential sites, availability.

Solar Energy: measurement and collection, flat plate collectors, concentrating collectors, solar ponds, photovoltaic conversion, Thermal energy storage, Potential and scope of solar cooling, Types of solar cooling systems.

Ocean Energy: Principles of OTEC (Ocean Thermal Energy Conversion) - wave energy, tidal energy, energy conversion systems.

Module-2

Wind Energy: Principle, potential and status; Wind characteristics; Measurement of wind speed, Wind direction; National Wind Atlas; Theory of wind turbine blades; types of wind turbines and their characteristics.

Bio-fuels: Sources and potential, properties and characterization; Biogas generation through aerobic and anaerobic digestion, bio-diesel and ethanol production and utilization. Thermo-chemical methods of biofuel utilization: Combustion and gasification; utilization of producer gas for thermal and electricity generation.

Module-3

Geo-thermal Energy - nature, types and utilization.

Recent trends in renewable energy - Flow Induced Vibration as a source of energy, Hydrogen energy.

Applications: Applications of renewable energy sources - typical examples. Energy audit.

Course outcome

CO1: Explain the technical functioning and principles of various techniques for the utilisation and conversion of renewable energy

CO2: Mathematically illustrate and model renewable energy processes and perform calculations for different technical solutions

CO3:

Identify different challenges in implementation of different renewable energy systems. CO4: Identify the scope of further research in each renewable energy technology.

25TF658	Turbomachines	L	T	P	C
		3	0	0	3

Module-1

Hydraulic machines: Impact of jets on vanes: flat, curved, stationary and moving vanes - radial flow over vanes. Impulse and reaction turbines: Design concepts- performance characteristics- work done and efficiencies. Centrifugal pumps: Working principle- Performance characteristics- Energy transfer and Efficiencies- NPSH Cavitation – Trouble shooting.

Module-2

Thermal turbomachines: Fundamental equation of energy transfer - specific work- representation of specific work in T-S and H-S diagrams – performance - losses and efficiencies - flow coefficient - loading coefficient - degree of reaction - shape number - specific speed - polytropic efficiency - Two-dimensional cascade theory- Cascade nomenclature: lift and drag - losses and efficiency - compressor and turbine cascade performance- correlations for turbine and compressor performance, Hawthorne’s correlation- Soderberg’s correlation

Module-3

Axial flow machines: turbines, compressors, and fans- two-dimensional theory- Velocity diagram - stage losses and efficiency- design and off-design characteristics, Centrifugal compressors – theoretical analysis – impeller, diffuser and casing- optimum design of compressor-inlet pre-whirl - slip factor- pressure ratio- choking in a compressor stage- surge, and stall. Radial flow turbines: types of inlet flow – efficiency- off-design characteristics- loss coefficients.

Experiments and CFD: Experimental methods to measure flow and thermal fields in turbomachines
 – Application of CFD in analysis and design of turbomachinery.

Course Outcomes

- CO1: Capability to analyse the performance of turbomachines
- CO2: Ability to select turbomachines for different applications
- CO3: Predict performance of turbomachine using model analysis
- CO4: Conduct research studies on turbo machines to improve their performance

GLIMPSES OF INDIAN CULTURE

P/F

22ADM501: GLIMPSES OF INDIAN CULTURE

A. Prerequisite: nil

B. Nature of Course: Theory

C. Course Objectives:

- The course "Glimpses of Indian Culture" aims to provide students with a comprehensive understanding of various aspects of Indian culture, with a focus on its spiritual, philosophical, and religious dimensions.
- Through an exploration of the chapters from the provided book, students will gain insights into the foundational principles, practices, and symbols that shape the diverse cultural landscape of India
- Aligned with the Indian Knowledge Systems (IKS) framework outlined in the National Education Policy, this course serves as an introduction to the vast reservoir of wisdom and knowledge rooted in Indian heritage.
- By engaging with the chapters in the book, students will develop a holistic appreciation for the rich tapestry of Indian culture, spanning from its philosophical underpinnings to its artistic expressions, rituals, and societal values.
- This course aims to cultivate cultural sensitivity, critical thinking, and a deeper understanding of the diverse spiritual and cultural traditions that have shaped India's identity over millennia.

D. Course Outcomes: After successful completion of the course, Students will be able to:

CO	Course Outcomes	Knowledge level [Bloom's Taxonomy]
CO01	Recall key concepts and terms associated with Sanatana Dharma, scriptures, and core cultural elements of India. Statement: Demonstrate the ability to remember essential terms, concepts, and principles discussed in the chapters on Sanatana Dharma, scriptures, and cultural aspects.	Remembering
CO02	Explain the concepts of Īśvara, Guru Tattva, Avatara Tattva, and the Theory of Karma as foundational elements of Indian cultural philosophy. Statement: Understand the profound meanings of Īśvara, Guru, Avatara, and Karma, elucidating their importance in shaping Indian cultural thought.	Understanding
CO03	Apply the knowledge of Purusharthas, Sanyasa, and Yajna to analyze real-life ethical and spiritual scenarios. Statement: Utilize insights from Purusharthas, Sanyasa, and Yajna to navigate ethical dilemmas and make informed decisions.	Applying
CO04	Analyze the symbolism in cultural practices, Nataraja iconography, and temple architecture. Statement: Deconstruct the layers of symbolism in various cultural aspects, including Nataraja representation and temple architecture, unraveling their deep meanings.	Analyzing
CO05	Evaluate the significance of temples as cradles of culture and explore alternative systems in India's cultural landscape. Statement: Assess the role of temples in preserving cultural heritage and critically examine the diversity of cultural and spiritual systems in India.	Evaluating
CO06	Develop projects or presentations that highlight the essence of Sanatana Dharma, sadhana, and the cultural significance of symbols. Statement: Create expressive projects that capture the essence of Sanatana Dharma, convey the practices of sadhana, and portray the cultural meanings of symbols.	Creating

F. SYLLABUS GLIMPSES OF INDIAN CULTURE

[P/F]

Course Syllabus

- Chapter 1 - What is Sanatana Dharma
- Chapter 2 - The Heritage of Scriptures
- Chapter 3 - The idea of Ísvara
- Chapter 4 - Guru Tattva and Avatara Tattva
- Chapter 5 - Theory of Karma
- Chapter 6 - Purusharthas
- Chapter 7 - Sanyasa
- Chapter 8 - Yajna
- Chapter 9 - Symbolism
- Chapter 10 - Understanding Nataraja
- Chapter 11 - Temples: The Cradle of Culture
- Chapter 12 - Other Heterodox Systems in India
- Chapter 13 - Sadhana

GLIMPSES OF INDIAN CULTURE
